Using Adobe Premiere Pro CS6 for Green Screen Editing on an iMac

After you have logged onto the computer, click on the Adobe Premiere Pro CS6 icon in the dock.

1. Create a new project → NAME it, don’t change the settings → Use the default sequence settings.
2. Drag and drop clips from Finder → drag background image to Video 1 on the timeline.

3. Drag Green Screen video to Video 2. If you have two or more videos, then drag/import them from Finder to Video 2. The files will then be side-by-side.
Once you have imported your video(s) and image, go ahead and drag the image to the end of the video(s).

Right click on the video then click on “Scale to Frame Size” then move onto the next step.
4. Bottom lower left hand panel ➔ Click on “Effects tab” ➔ “Video Effects” ➔ “Keying” ➔ “Ultra Keying”.

5. In upper left hand panel ➔ Click on “Effect Control Tab” then take the eyedropper and click anywhere on the green background. The green background will then disappear.

Drag the green screen video down by double clicking on it.
Double click on the background image then click and drag a corner to make it bigger so it will fit the screen.

Click on the video in the timeline (so it is highlighted) then drag the video from the top screen (step 5) over the image.
6. Save the file by clicking on File → Export → Media → Format saves as Quick Time & Video Codec is H.264.

a. No 3gp
b. Output name (Where you can find it later)
c. Export (The amount of time it takes to export depends on the file size. Be patient and prepared to wait a little bit)
You can import the Adobe Premiere Pro CS6 video to iMovie to tailor your video by adding music, images, captions and much more!

1. Create a new event → Import media file – you can import other media (images and music) during this stage as well.

2. Once you have imported the file and it has downloaded, double click on it to highlight the whole sequence, then click on the plus symbol to add it to the timeline. You can also drag and drop the highlighted sequence onto the timeline.
3. Follow the same instructions for step two when adding music.
4. Located at the bottom of the left hand corner, there is a selection of tools you can use such as Transitions, Titles, Maps & Backgrounds, iTunes, Sound Effects, and GarageBand (see step 2 image).
5. Once you are finished, click on the “Share” icon at the top of the screen and export the file.
6. You can share the file to Theater (iMovie Theater), Email, iTunes, YouTube, Facebook, Vimeo, CNN iReport, and File. File is the best option because it shares the video as a QuickTime file and can be sent in an email, saved anywhere on the computer and saved on a USB.
